L5: Entry 13 of 19

File: USPT

Nov 17, 1998

DOCUMENT-IDENTIFIER: US 5837499 A

TITLE: DNA encoding C5A receptor antagonists having substantially no agonist activity and methods of expressing same

Brief Summary Text (7):

Complement is beneficial when directed against an appropriate target such as invading microorganisms or tumor cells, but has clear pathogenic potential if activated inappropriately. For instance, the anaphylatoxins, e.g., C5a, have been implicated as causative or aggravating factors in the pathogenesis of several inflammatory diseases such as adult respiratory distress syndrome and rheumatoid arthritis. Bautsch et al., Biochem. J. 288:261-266 (1992); Haslett et al., J. Immunol. 142:3510-3517 (1989). In particular, the aberrant presence of C5a in tissue has been detected in patients afflicted with rheumatoid arthritis, osteoarthritis, psoriasis and noncardiac pulmonary edema. C5a has been found to be a principal inflammatory mediator produced by complement activation by virtue of additional activities that include recruitment and stimulation of inflammatory leukocytes and augmentation of antibody production. See Mollison et al., Proc. Natl. Acad. Sci. USA 86:292-296 (1989).
